AUTHOR: Anichkov, N.N., Academician (Leningrad)

TITLE: Some Urgent Tasks of Medical Sciences (O nekotorykh aktual'nykh zadachakh meditsinskoy nauki)

PERIODICAL: Priroda, 1959, Nr 2, pp 11-13 (USSR)

ABSTRACT: In connection with the sharp decrease in the number of cases of infectious diseases, the attention of scientists working under the direction of the author in the Institut eksperimental'noy meditsiny AMN SSSR (Institute of Experimental Medicine of the Academy of Medical Sciences of the USSR) is presently attracted to the study of diseases of cardiovascular and digestive systems. In the first group the principal disease is "aterosclerosis", wrongly called arteriosclerosis. The scientists found that "aterosclerotic" changes in arteries are, to a certain point, reversible. Fat substances deposited in them can be "washed out" and so the progress of the disease stops. The problem of cancerous diseases is also an object of unceasing studies. There is 1 photo.

Chemical receptors of the carotid sinus region: action of sodium azide. S. V. Anichkov. *Bull. Exptl. Biol. Med.* 10, No. 4:37-73-7 (1945). Action of NaN_3 on carotid reflexes was studied on dogs under anesthesia by the 3 methods described by C. Heymans: (1) Injection of 2 cc. of 1% soln. of NaN_3 into the saphenous vein before and after denervation of the sinuses. (2) Dissection of one carotid bifurcation, ligation of all branches except the lingual. Injection of a soln. (1:20,000-1:1,000) into the common carotid stimulated respiration when the innervation of the sinus was intact but not after denervation. (3) Isolation and cannulation of the sinus itself, ligation of all vessels except carotid and lingual. Injections of NaN_3 caused a reflex stimulation of the respiration. Conclusion: NaN_3 acts on carotid chemoreceptors through the cytochromoxidase system.

"N. P. Kravkov and the Problems of Modern Pharmacology," S. V. Anichkov, 9 pp

"Zaur Obshechey Biologii" Vol VIII, No 3, p. 229

N. P. Kravkov was the founder of Russian experimental pharmacology. According to his views, the main object of pharmacology was to study the essentials of the interaction between drugs and protoplasm. In full accordance with his ideas, the study of the action of drugs upon the enzymal systems of protoplasm is one of the problems of modern pharmacology. The methods of perfusion of isolated organs, elaborated by the Kravkov school, are most convenient for the solution of problems of general theoretical pharmacology.

"The Action of Curare on the Carotid Bodies (Pharmacological Analysis of the Carotid Chemoreceptors)," S. V. Anichkov, Chair of Pharmacology of the 2d Leningrad Medical Institute, 7 pp

"Fiziologicheskii Zhurnal" Vol XXXIII, No 3

Discussion of experimental results illustrated with recordings of a dog's respiration. It is concluded on the data that there are receptors in the carotid bodies analogous to the receptors in the ganglion cells, but the proposition is refuted that these receptors participate in the transmission of stimuli arising in the carotid bodies.

the nerve ends to the cells of these glands is also realized with the aid of chemical mediators. The chemical nature of the basic mediators (acetylcholine and very close to adrenaline sympathetics) does not cause any doubt, but the effect of the mediators upon the cells through which the impulses are transmitted remains undetermined. As far as experience shows, all endocrine glands, whose function is the development and exertion of biologically active substances, are the only useful objects in studying the intimate mechanisms of interrelation between the mediators and the biochemical systems of the tissues. Certain experimental data on the characteristics of neurohumoral regulations of secretions of the cerebral stratum of suprarenal and neurohypophysis are discussed in the report. These glands, in contrast to other endocrine glands, can be named neurogenic endocrine glands. Neurohypophysis is actually a derivative of the cerebral tissue, and the chromaffin cells of the suprarenal have a more general embryological connection with the cells of the sympathetic ganglions.

ANIČKOV, S. ANICHKOV, S.

*Učinky liečiv na nervovú reguláciu. The action of drugs on nervous regulations
ČAS. LÉK. ČES. 1953, 92/29 (791-793)

A review of some recent Soviet advances in pharmacology of the nervous system. The 2-diethylaminoethyl ester of diphenylacetic acid ('difacil'; 'trasentin') (I) has, besides its known spasmolytic effect, a ganglioplegic action, peculiar actions on the CNS and a definite local anesthetic action. In doses which do not affect the peripheral nervous system it modifies conditioned reflexes in dogs. Further it was found that extracts from the plant *Magnolia chinensis*, used in popular medicine, affect conditioned reflexes, activating the process of excitation. Lenkiewicz studied the influence of amidone ('fenadon'; 'phenadone' etc.) (II) on conditioned reflexes. The analgesic action is cortical, and not subcortical as is sometimes suggested. After administration of II, conditioned reflexes change before the unconditioned ones are affected. Therapeutic doses of the drug increase the inhibition process. An analogue of papaverine ('dibazol') has, besides its papaverine-like effect a marked influence on the CNS. In interrupting reflex arcs responsible for various pathological states, good effects are obtained with procaine blockade. However, I seems to be more suitable for this purpose. It may be used wherever a blockade of sympathetic ganglia or a regional cutaneous blockade is needed. Good clinical effects are produced by the drug in various peripheral pathological syndromes.

Title · Reflexes from chemoreceptors on endocrine glands

Periodical · Fiziol. zhur. 4, 420-423, Jul/Aug 1954

Abstract · Movements of reflexes from chemoreceptors on endocrine glands may be regarded as association between sensitive chemo-analytical formations and organs that carry out the function of specific chemical synthesis. Such an association is perfectly normal and physiologically sound if the chemical reception regulating it is regarded as signaling the shifts taking place in tissue metabolism. The reflex regulation of endocrine glands, like all other phases of nervous regulation of physiological functions, does not flow independently, but is controlled by the cortex of the brain. This supports A. A. Belous' contention that it is possible to form conditioned reflex associations on the basis of reflexes from carotid bulbs on hypophysis. Five Soviet references.

92. Rational Synthesis of New Drugs

In an article entitled "The Problem of Rational Synthesis of New Medicinal Preparations," Prof S. V. Anichkov, Corresponding Member of Academy of Medical Sciences USSR, discusses the methods of synthesis of new drugs. One is a purely empirical method in which a large number of compounds are synthesized with the hope that one of them may prove to be pharmacologically active. The other method is that of rational and directed synthesis of preparations which are pharmacologically active because of their chemical structures and their physicochemical properties.

The author describes the synthesis of carboxylin, a preparation pharmacologically similar to acetylcholine; the synthesis of aleudrin which like adrenalin relaxes the bronchial muscles without raising blood pressure; the synthesis of other preparations, such as vitamins and anti-vitamins, mediators, hormones, and antihistamines. An extensive bibliography of USSR and foreign authors is appended. (Vestnik Akademii Meditsinskikh Nauk SSSR, Vol 1, No 6, Nov/Dec, 56, pp 33-45) (U)

Control of the Underbark Bug.

Orig Pub : Tr. Vses. in-ta zashchity rast., 1957, vyp. 8,
165-172

Abstract : In the Saval' summer resort, regardless of the age
of trees and the presence and absence of dry
litter, the basic mass of the bugs (B) in 1954
concentrated for hibernation in the bark of the
root collar. There was practically no B on the
trunk and on the litter which was 50 cm. away from
the trunk. B were completely absent only on
